gitalelectronicsbookbysalivahananpdf13.This
invention relates generally to the
manufacture of vinylidene halide fibers and
more particularly to the manufacture of
vinylidene chloride fibers. The prior art
discloses that vinylidene halide fibers can be
made by extruding a vinylidene halide

extrudable material through the extrusion die of an extruder in the form of a thick tow having a diameter of about 1/4 to about 3 inches, collecting and compacting the tow, and converting the tow to individual fibers or filaments through such means as an air jet, high velocity water jet, rotary cutter or rotary knife. Typically, such fiber forming means are positioned such that the pressure on the fiber or filament is applied in a direction perpendicular to the axial direction of the tow. The results are fibers having a triangular cross-section. The extrusion die which is a critical part of the extruder comprises a die orifice or orifices through which the vinylidene halide extrudable material is discharged in the form of the thick tow having a diameter of about 1/4 inch. Also, a die lubricating system is provided for the proper operation of the die. Unfortunately, the use of such apparatus and process leads to the formation of small particles of vinylidene halide in the viscous material which will be extruded from the die

A: Presumably it's a hidden character in the code, but I couldn't figure out how. One would hope that you could post the entire code in question to see what it looks like, but I can see that you're a bit pressed for time so I'll leave it up to you to figure it out.
